

***Interactive comment on “Large-Eddy Simulation Sensitivities to Variations of Configuration and Forcing Parameters in Canonical Boundary-Layer Flows for Wind Energy Applications” by Jeffrey D. Mirocha et al.***

**Anonymous Referee #2**

Received and published: 7 December 2017

Dear Authors,

The article is very interesting and is overall well formulated. It does approach a very interesting and important research area. It further contributes with important results, comparing a number of models, interesting for the research community.

The performed simulations are performed for specific stability cases, please explain why these cases have been selected and others have been left out and to what extent these cases are relevant for the field. Perhaps the cases are chosen due to available

C1

measurements data?

There are parts of the text where clarifications could improve the quality and readability of the article. For example, further explanation regarding the used measurement data and also the comparison between the measurements and LES data, is needed.

I recommend this article for publication after minor revision based on the above comments.

Best regards
