

Review of the revised manuscript:

M. P. van der Laan, S. J. Andersen and P-E. Réthoré:

"Brief communication: Wind speed independent actuator disk control for faster AEP calculations of wind farms using CFD"

The authors are thanked for considering my remarks and for the revision of the manuscript. The paper is now much more comprehensible. The clarification that the Reynolds number independence applies only to the specific turbulence model used and the related verification in the appendix is important to understand and accept the suggested approach. I support publication of the submission without further changes. Please note the small typo at p. 3, line 7: "Hence, it assumed" → "Hence, it is assumed..."
