

## Review (reviewer #3):

---

This is a second review for the paper “Scaling effects of fixed-wing ground-generation airborne wind energy systems (2022).” Thank you for the detailed response and explanations to my questions and of others, it definitely drastically improved the quality of the paper. However, I would like to give one very little recommendation as a response to your answer at “figure 15”. I can follow your reasoning and in the end it is your choice for what you feel is better in communication but try to be consistent in Figure 14 and Figure 15. They communicate the same values but differ in the way of presenting, L/W and L/D & W/L and D/L. Also I think Figure 15 should not be a percentage, Newton/Newton is still a ratio with no unit. After implementing this, your paper seems ready for publication.
