Dear the editor and reviewers,

We would like to appreciate your honorable work on organizing the journal and the thoughtful comments based on your experiences and insights. The comments help us again to improve the manuscript.

Based on your comments, the manuscript has been revised. We tried to justify the use of URANS predicting dynamic stall and XFOIL for the polar prediction, still mentioning the limitations of using those more specifically. The definitions and changes of MCSP and TESP are more specifically described. The changes are marked as orange in the track-change file.

Sincerely

Hye Rim Kim on the behalf of the authors
